GOALS AND OBJECTIVES. The Goals and Objectives of the CCWUI Project are to:

- 1. Create defensible space near structures and values at risk, thin forests, and reduce fuel loadings to reduce wildfire risk in the wildland urban interface, communities, and the overall landscape within the Project Area; and
- 2. Thin forests and reduce fuel loadings to improve forest health, create more resilient forests and watersheds, restore natural forest conditions, and promote wildlife habitat and biodiversity.

 Stumps should be cut as low as reasonably possible. Stump height of cut trees and brush as measured from the uphill side of stump is not to exceed: a) six inches (6") in height within the Home Ignition Zone and for hand work; and b) twelve inches (12 in height for heavy equipment work. Maximum chip depth from onsite mulching will be six inches (6") unless otherwise specified herein. Equipment work will be performed when the ground is reasonably dry or frozen. Unless otherwise specified, the maximum rutting allowable by equipment is four inches (4") over 150 continuous feet. SIGNATURES By signing, the Landowner or Agent acknowledges that a meeting with a CWA Representative has occurred for discussing defensil space, forest thinning, and fuels reduction work and for formulating this Practice Plan. Landowner may opt to proceed without ar person site visit by submitting a written waiver confirming review and acceptance of the Agreement, Practice Plan, and related documents. Execution of this Practice Plan does not assure project work on the property due to funding constraints. Selection for work is based on project priorities, selection criteria and available funding. This Practice Plan, along with the Agreement and any additional documents, authorizes CWA and its Partners to start the agreed-upon work on the Landowner's property. BY SIGNING BELOW, the Landowner or Agent and the CWA execute this Agreement effective from the last signature date. This Practice Plan
Landowner also authorizes the use of heavy forestry equipment to implement thinning work. This may be modified with written approval of the Landowner or Agent (list areas where heavy forestry equipment use is not authorized): PROPERTY BOUNDARY & UTILITIES LOCATION & MARKING INFORMATION TREATMENT PLAN, METHODS, & AREAS Stumps should be cut as low as reasonably possible. Stump height of cut trees and brush as measured from the uphill side of stump is not to exceed: a) six inches (6") in height within the Home Ignition Zone and for hand work; and b) twelve inches (12 in height for heavy equipment work.
